Our program has five critical elements: 1) creation of a powerful experiential learning environment in the core discipline of Health Informatics; 2) team-based approach to the study of an emerging health issue; 3) intensive, problem-based learning experiences; 4) research training; and 5) interdisciplinary learning. These elements provide our students with a distinct and deep understanding of the dynamics of the current problems in their discipline, a frame of reference in which to solve complex, practical problems, and the tools to analyze, design, evaluate and evaluate the outcomes of a variety of health-related solutions. No we need to the don't mention need to pay the .Q: C# Interface Implementation I have been looking around for some examples on the web and see that it is fairly standard to use interfaces when you want to decouple things from the calling code. However, I am a little confused about the implementation of interfaces. Let's say you have the following interface that you intend to implement: `public interface IEngine { void DoSomething(); }` Now, let's say you have a class that implements this interface (likely in a form of a library): `public class SpecificEngine : IEngine { public void DoSomething() { Console.WriteLine("This is the engine of specific type"); } }` What I see now is that there is an abstract interface (that can be implemented) and a class that implements it. Is this a bad practice? Would the interface become useless if I changed the actual implementation to the following: `public class SpecificEngine : IEngine { public void DoSomething() { Console.WriteLine("This is the engine of specific type"); } }` A: If the interface is an abstraction of existing functionality, it's a good thing to separate that out. But if it is just a new function, a new set of functions, then you should maybe just add a new method. (The fact that it's an interface rather than a class has nothing to do with the decision.) In this particular case, it seems unlikely that you'd want to change the interface of the library, unless you were changing the behaviour of some existing functionality. (In that case, I'd suggest a new interface with the new functionality, just in case the interface was chosen for some other reason.)

Predictors of clinical response in patients with ulcerative colitis: a review. The goal of therapy in patients with ulcerative colitis is to induce remission. At present, there is no way of predicting which patient will respond to therapy. Up to now, clinical and laboratory predictors of response to therapy have been of little value. Until methods are available to predict response, therapy will continue to be
